Fri, 07 Dec 2018 19:49:00 GMT Heat transfer physics - Wikipedia - In systems involving heat transfer, a condenser is a device or unit used to condense a substance from its gaseous to its liquid state, by cooling it. In so doing, the latent heat is given up by the substance and transferred to the surrounding environment. Condensers can be made according to numerous designs, and come in many sizes ranging from rather small (hand-held) to very large (industrial ... In thermodynamics, heat means energy which is moved between two things when one of them is hotter than the other.. Adding heat to something increases its temperature, but heat is not the same as temperature. The temperature of an object is a measure of the average speed of the moving particles in it. The energy of the particles is called the internal energy. Fri, 07 Dec 2018 22:05:00 GMT Heat -
